## Course of education: 5B057-Information technology

Elective course No	Discipline	Number of credits	Prerequisites	Postrequisite s	Brief description indicating the purpose of the study, an outline and expected learning outcomes (knowledge, skills, competence)
				IC DISCIPLINI ure to select (BS	
1	Computer architecture	4	School informatics	Application packages program	The purpose of studying this discipline is to familiarize with the basic concepts of architecture of a modern personal computer (PC), with the device of the most important components of PC hardware, mechanisms for transmitting and managing information, and the main provisions of logical design.  Contents: Introduction. Types of information in the computer, encoding methods. Logical foundations of the computer, elements and nodes. computer architecture. A basic understanding of the architecture of a computer. Technology to improve the performance of the processor.  Basic principles of modern Pentium processors.  Multi-stage memory concept. External memory. Interfaces. Organizing a break. Architecture of the microprocessor system. Classification of a parallel data processing system. Organization of parallel computing in modern processors. Types of MP production technology.MP links and their main characteristics.  Expected result:  Know: basic concepts and principles of building the architecture of computer systems; types of computer systems and their architectural features; principles and organization of the main logical blocks of computer systems; information processing processes at all levels of computer systems software; basic principles of resource management and organization of access to these resources.  Be able to:to obtain information about the parameters of the computer system; to connect additional equipment and configuration of communication between elements of the computer system;  Installation and configuration of software for computer systems.  Skills: analysis of the work of computers, hardware upgrades of computers.

					The numerous of studying this discipline
1	Techics of computer and communicatio n systems	4	School informatics	Application packages program	The purpose of studying this discipline: familiarization with the basic concepts of architecture of a modern personal computer (PC), familiarization with the device of the most important hardware components.  Content: methods and types of aircraft organization; parallel information processing: levels and methods of organization; implementation on multi-machine and multi-processor aircraft; operating pipelines; vector, matrix, associative systems; homogeneous systems and environment; RISC architecture; development of architecture focused on language tools and programming environment; fundamentals of the metric theory of aircraft; distributed data processing technology; principles and architecture of computer networks; protocols, hierarchy and modes of operation: principles; information transfer in computer networks; communication channels, modems; encoding and error protection; packet structure; methods of switching channels, messages, packets; routing; basic means of data transmission; local area networks (LAN).  Expected result:  Know: hardware of computer and communication systems, as well as their technical characteristics and functionality.  Be able to: apply knowledge and skills in the preparation of applied practical problems using computer and communication systems technology.  Skills: applying basic computer and communication systems techniques
2	Application packages program	6	School informatics	SOFTWARE development basics	Purpose: Acquaintance of students with the software that can be used in the preparation of publications on the computer and technology integrated publishing systems, practical computer skills, receive hands-on experience with desktop publishing systems  Contents: Classification of software products. Definition and stages of PPP development. Classification and types of PPP. Problemoriented and method-oriented PPP. General purpose PPP. PPP computer-aided design and multimedia software. Office of the PPP. Desktop publishing systems.  Learning outcome:  Know:concept of software;development stages of a package of applied programs;history and stages of development of publishing in Kazakhstan; the concept of office software packages; the concept of desktop publishing;the concept and purpose of technical publishing tools;basics of working with the AdobePageMaker publishing system.

on their purpose; classify application packages into types; create texts with objects in AdobePageMaker; format texts in AdobePageMaker; format texts in AdobePageMaker; Format texts in AdobePageMaker; Format texts in AdobePageMaker; Skills: creation of publications by means of the program MicrosoftWord with possibilities of layout and layout; creation of documents in MicrosoftOfficePublisher; receptions and work with the text objects in AdobePageMaker.  Purpose: The purpose of mastering the discipline "Applied software" is to form a holistic view of the principles of construction and operation of modern operating systems; the place and rote of modern technologies in solving applied problems on a computer.  Content: methods of setting and solving scientific and practical problems on a computer with the context of the principles of construction and operation of modern operating systems; the place and rote of modern technologies in solving applied problems on a computer.  Content: methods of setting and solving scientific and practical problems on a computer with the content technology with hardware and software. Knowledge of programming allows the future specialist to freely navigate the sea of information, work with databases.  Learning outcome:  Know: to Know classification of system and applied software; appointment and possibilities of the basic and applied software; theoretical bases of applied software; appointment and possibilities of the basic and applied software covering all the features and purpose of the basic and applied computer software.  Skills: modeling methods, information technology management  The purpose of studying this discipline is to form the knowledge and skills necessary for managing information resources in solving professional, educational and scientific tasks that meet the requirements of the information society.  Content: web content, text, graphic and applied computer software: when the meet the requirements of the information society.  Content: web content, text, graphic and appli						<b>To be able:</b> classify software products depending
a dobePageMaker; format texts in AdobePageMaker; format texts in AdobePageMaker. Skills: creation of publications by means of the program MicrosoftWord with possibilities of layout and layour, creation of doublest and layout possibilities of layout and layour, creation of powelloster, or care in publishing systems; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and creation of multipage publications in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; receptions and work with the text, objects in AdobePageMaker; of allowers in AdobePageMaker;						
AdobePageMaker, work with objects in AdobePageMaker: format texts in AdobePageMaker. Skills: creation of publications by means of the program MicrosoftWord with possibilities of layout and layout, creation of documents in MicrosoftOfficePublisher, receptions and ways of creation of booklets and layout of layouts of in MicrosoftOfficePublisher, work in publishing systems; receptions and creation of multipage publications in AdobePageMaker. Receptions and creation of multipage publications in AdobePageMaker. Purpose: the purpose of mastering the discipline "Applied software" is to form a holistic view of the principles of construction and operation of modern operating systems; the place and role of modern technologies in solving applied problems using a computer.  Software  Software  Software  Software  Software  Software  Software  Software from the chologies in solving applied problems using a computer, methods and methods of working with hardware development basics.  Learning outcome:  Know: to Know classification of system and applied software; specialist to freely navigate the sea of information, work with databases.  Learning outcome:  Know: to Know classification of system and applied software; the computer.  Be able to: use the application software of the computer.  Be able to: use the application software covering all the features and purpose of the basic and applied software of the computer.  Be able to: use the application software covering all the features and purpose of the basic and applied computer software.  Skills: modeling methods, information technology, management  The purpose of studying this discipline is to form the knowledge and skills necessary for managing information resources in solving professional, educational and scientific tasks that meet the requirements of the information support for business processes of organizations.  Expected result:  Must know:  Learning outcome:  Learning outcome:  Know: to Know classification of system and applied computer software.  Skills: modeling metho						
AdobePageMaker, format texts in AdobePageMaker, Skills: creation of publications by means of the program MicrosoffUnd with possibilities of layout and layout: creation of documents in MicrosoftOffice Publisher; receptions and ways of creation of bookles and layout of layouts of work in MicrosoftOffice Publisher; receptions and ways of creation of multipage publications in publishing systemszeeptions and work with the text, objects in AdobePageMaker, receptions and creation of multipage publications in AdobePageMaker.  Purpose: the purpose of mastering the discipline is not modern technologies in solving applied problems using a computer.  Content: methods of setting and solving scientific and practical problems on a computer, methods and methods of working with hardware and software. Knowledge of programming allows scientific and practical problems on a computer.  Content: methods of setting and solving scientific and practical problems on a computer.  Content: methods of setting and solving scientific and practical problems on a computer.  Row: to Know classification of system and applied software: spopitiment and possibilities of the basic and applied software of the computer. Be able to: use the applications offware covering all the features applied software of the computer. Be able to: use the applications offware covering all the features and purpose of the basic and applied computer software. Skills: modeling methods, information technology, management  The purpose of studying this discipline is to form the knowledge and skills necessary for managing information resources in solving professional, educational and scientific tasks that meet the requirements of the information sciety. Content: web content, text, graphic and support for business processes of organizations. Expected result:  Mutilimedia content of websites, information resources, the structure of information resources, the structure of information resources, the structure of information or resources, the structure of information of resources a						
AdohePageMaker. Skills: creation of publications by means of the program MicrosoftWord with possibilities of layout and layout, creation of documents in MicrosoftOffice Publisher; receptions and ways of creation of booklets and layout of layouts of work in MicrosoftOffice Publisher; receptions and work with the text, objects in AdohePageMaker; receptions and creation of multipage publications in AdohePageMaker; receptions and creation of multipage publications in AdohePageMaker.  Purpuse: the purpose of mastering the discipline "Applied software" is to form a holistic view of the principles of construction adopteration of modern operating systems; the place and role of modern technologies in solving applied problems using a computer.  Software  S						
Skills: creation of publications by means of the program MicrosoftWord with possibilities of layout and layout; creation of documents in Microsoft Office Publisher; receptions and ways of creation of booklets and layout of layouts of layout of work in MicrosoftOffice/Publisher; receptions and work with the text, objects in AdobePageMaker; receptions and creation of multipage publications in AdobePageMaker.  Purpose: the purpose of mastering the discipline "Applied software" is to form a holistic view of the principles of construction and operation of modern operating systems; the place and role of modern technologies in solving applied problems using a computer.  Content: methods of setting and solving scientific and practical problems on a computer, methods and methods of working with hardware and software. Knowledge of programming allows the future specialist to freely navigate the sea of information, work with databases.  Learning outcome:  Know: to Know classification of system and applied software; theoretical bases of applied software; appointment and possibilities of the basic and applied computer software.  Skills: modeling methods, information technology, management  The purpose of studying this discipline is to form the knowledge and skills necessary for managing information resources in solving professional, educational and scientific tasks that meet the requirements of the information society.  Content: we content, text, graphic and multimedia content of websites, information technology management  Web  Meevelopment communication technology and the sea of information resources in professional, educational and scientific tasks that meet the requirements of the information society.  Content: we be content, text, graphic and multimedia content of websites, information resources the process of formation of information resources, the the information society						
program MicrosoftWord with possibilities of layout and layout; creation of documents in Microsoft Office Publisher; receptions and ways of creation of booklets receptions and ways of creation of booklets receptions and ways of creation of booklets receptions and work with the text, objects in Adobet PageMaker.  Purpose: the purpose of mastering the discipline "Applied software" is to form a holistic view of the principles of construction adoperation of modern operating systems; the place and role of modern operating systems; the place and role of modern technologies in solving applied problems using a computer.  Content: methods of setting and solving scientific and practical problems on a computer, methods and methods of working with hardware and software. Knowledge of programming allows the future specialist to freely navigate the sea of information, work with database. Learning outcome:  Know: to Know classification of system and applied software; theoretical bases of applied software; theoretical bases of applied software; theoretical bases of applied software; appointment and possibilities of the basic and applied software of the computer. Be able to: use the application software covering all the features and purpose of the computer. Be able to: use the application software covering all the features and purpose of the computer. Skills: modeling methods, information technology, management  The purpose of studying this discipline is to form the knowledge and skills necessary for managing information resources in solving professional, educational and scientific tasks that meet the requirements of the information society. Content: web content, text, graphic and multimedia content of websites, information resources the process of formation of information resources, the structure of information resources, the information society.

					use of computer programs, Internet resources; work with electronic documents.  Skills: access to electronic information resources, as well as libraries and archives.
3	Information systems	6	Information and communication technology	Web development Multimedia technologies	The purpose of studying this discipline: effective performance of professional tasks, search and use of information necessary for professional and personal development.  Contents: use the navigation on the Internet. Defining the structure of WWW addresses. The use of antiviral prophylaxis. Working with email. Using special programs for downloading files.  Expected result:  Know: theoretical bases of construction and functioning of modern personal computers; types of computer networks; principles of multimedia use; functions and technologies of information and telecommunication services.;  Be able to: search for necessary data using query languages and directories in various information systems (databases, electronic libraries, websites), organize access to information resources, organize the work of specialists with information resources:  Skills:  Methods of searching and analyzing information on the Internet; search for information from various sources; analysis of relevant information, clarification of demand in order to improve search efficiency; work with modern information resources.
4	Discrete mathematics	5	Mathematics 1, Mathematics 2	Numeral Methods	Purpose: the course of discrete mathematics is one of the elements of the Foundation of the student's education, which is of great importance for the successful assimilation of General and special disciplines and allows you to navigate the flow of scientific and technical information. The study of discrete mathematics contributes to the development of logical and algorithmic thinking of students, the development of their research techniques and solutions of mathematically formalized problems, the development of the ability to independently analyze applied problems and expand, if necessary, their mathematical knowledge.  Content: the basic unit of discrete mathematics to analyze and model real-world processes in the conditions of professional activity; — training the students to apply the received knowledge in practice;  Learning outcome:  Know: basic concepts of sets; algebraic methods of model description; elementary functions of the algebra of logic, properties and their analytical

					representation; bases of logical calculus of statements and predicates; methods for solving classical problems formulated in terms of combinatorics.  To be able: apply combinatorial configurations to solve problems determine the type of binary relation and its properties, perform operations on sets, represent graphs in various ways, perform operations on graphs, find the shortest path of the graph, build truth tables Boolean functions, perform identical transformations, find sdnf, SKNF, determine the minimum DNF.  Skills: application of basic tools of discrete mathematics to solve applied problems; methods of construction, analysis and application of discrete models in professional activities.
4	Math statistics	5	Mathematics 1, Mathematics 2	Numeral Methods	Purpose: the purpose of the discipline is the formation of future specialists of theoretical knowledge and practical skills in such areas of higher mathematics as mathematical statistics. Also, the objectives of the study are to demonstrate to students the specifics and role of the course "Mathematical statistics" in the study of economic processes by the examples of mathematical concepts and methods. It is necessary to develop students 'ability to analyze the results, to instill the skills of independent work and study of literature.  Content: basic concepts: events, their types. Random variable. Definition, types of random variables. Binomial law of probability distribution. Continuous random variables. Statistical estimation of distribution parameters. General and selective population. Variation series and its characteristics.  Learning outcome:  Know: the method of carrying out the evaluation of the probability of the main numerical characteristics of random variables; test the hypothesis about the parameters and laws of distribution of random variables;  To be able: Calculate the probability of random events;  Skills: calculating the numerical characteristics of random variables;
5	Theory of languages and automata	5	Languages and technology of programming	Systems of artificial intellect, Theory of programming languages and translation methods	Purpose: the article analyzes in detail the similarities and differences of natural and information languages and outlines ways to build information languages of different types and their grammars.  Content: basic concepts of the theory of algorithms and the theory of formal grammars.  Recursive functions, primitive recursion and minimization. Description of Turing machines, methods of their representation, operations on Turing machines. Algorithmically unsolvable problems of algorithm theory basic concepts of

					formal grammars and languages. Classification of grammars, parsing strategies, and equivalent transformations of K-grammars.Different types of automata (finite state machines, automata with stack memory, the machines of Mile and Moore) and their relationship with grammars and languages.Distinguish between translators, having the skills to work in them. To solve logic problems προγραμμε Turbo prolog  Learning outcome:  Know: basic concepts of the theory of formal languages and automata; algorithmic languages; basics of programming  Tobe able: analyze basic information about tasks that require the construction of formal languages, write formal definitions of such languages, build and analyze algorithmic means of analysis of such languages:  Skills: solving problems encountered in the
5	Algorithmic languages and programming	5	Languages and technology of programming	Systems of artificial intellect, Theory of programming languages and translation methods	Skills: solving problems encountered in the design and implementation of software projects aimed at building compilers and other means of processing formal languages.  Purpose:the discipline is the formation of students 'scientific, creative approach to the development of technologies, methods and means of software production  Content: the Course is devoted to the study of high-level programming techniques. Deals with the standard tasks and the typical examples from the practice of programming. Solving computational and programming problems.  Learning outcome:  Know: algorithmic methods; features of the structure, organization and practical implementation of algorithms; know the basics and prospects of new technologies  To be able:Consider the properties of algorithms and the situations in which these algorithms can be useful; to create various programs using fundamental computational algorithms and their properties, leading to linear,branching and cyclic type of algorithms; to process arrays using various methods of internal sorting; to investigate the relationship with the analysis of algorithms; to analyze the effectiveness of algorithms; to practically use the construction of models and
6	Computer SOFTWARE	5	Application packages program	The theory of programming languages and	data structures, to conduct subsequent analysis of the results.  Skills: development of algorithms and programs for solving problems; practical work on the use of modern software, modern computer technology  Purpose: The main purpose of the course is to prepare students for the use of technologies and tools for SOFTWARE development both in the

				translation methods	process of studying at the University and in subsequent professional activities.  Content: Programming in a high-level language. Object oriented programming. Theory of programming languages and methods of translation. Methods of functional modeling IDEF0.DFD data flow modeling methods. Software development technology Toolkit. Organization of collective work on SOFTWARE creation.  Learning outcome: Know: visual programming Systems. Fundamentals of management theory. To be able: Methods and means of protection of computer information.  Skills:brain-computer system. Arm and CAD. Interactive graphics systems. Artificial intelligence system. Programming on the Internet
6	Practices on the electronic computer	5	Application packages program	The theory of programming languages and translation methods	Purpose: to Promote the development of creative potential of students through the study of personal computer devices. To give an idea of modern information technologies. Learn to navigate the Windows operating system, use popular programs, the Internet. Learn to upgrade and repair PCs.  Contents: Software.Local area network. Hardware of a personal computer and its features. The hardware of the computer. Programming system, basic functions and components. Databases and database management systems. An overview of the packages Mathematica, Maple, MathCad. The application software of the Linux OS. Graphics package.  Learning outcome:  Know: the Hardware of the computer.  To be able: Software computerization  Skills: system, service and application software.
7	Art programming	5	Information and communication tecnologies (in English)	Programming in Python 3	The purpose of studying this discipline: to familiarize students with the basics of robotics, to teach the program of mobile robots  Contents: Fundamentals of robotics. Physical fundamentals of robotics. Information in modulating, information processes. Design basics Mobile work From simple to

				<u> </u>	
					Be able to: design automation and robotization systems; compare with the use of modern software products for robotization of technological complexes and systems for automating production processes in various industries, as well as artificial intelligence methods.;  Skills: formation of modern trends in the
					development of production process automation and robotics systems
7	Basic of programming	5	Information and communication tecnologies (in English)	Programming in Python 3	The purpose of studying this discipline is to develop the ability to creative self-realization through the development of design skills in the process of creating robotic systems.  Contents: Robot actuators.Computing devices in the control system for robots and flexible production modules. Software control systems for industrial robots. Adaptive robot control systems. Robot sensitivity systems.Remote-controlled robots and manipulators. Solving software problems of applying robotic systems.  Expected result: Know: industrial robot control system; about remote controlled robots; Be able to: solve problems of programming the use of robotic systems  Skills: formation of work on the organization of processing; organization of work on the collection, storage and processing of information used in the field of professional activity
8	Computing modelling	5	3D graphics and animation	Multimedia technologies	Purpose:to expand students 'understanding of modeling as a method of scientific knowledge, to introduce the use of computer as a means of knowledge and research activities  Content: Introduction to the basis of computer modeling. Classification of types of models simulation of random numbers simulation of random events Simulation of continuous random variables. Modeling discrete random veicinasanai computer simulation. Modeling of mass service systems computer modeling of economic and organizational systems  Learning outcome:  Know: typical classes of models and methods of modeling complex systems, the apparatus of the Monte Carlo method, the principles of constructing models of the processes of functioning of complex systems, methods of formalization and algorithmization;  To be able: use a systematic approach in the study, design and operation of information systems, develop modeling algorithms and implement them using algorithmic languages and software packages modeling, automate the design process using modeling databases.  Skills: use of computer modeling tools to create psychological comfort of the user

8	Matematical and computer modeling	5	3D graphics and animation	Multimedia technologies	Purpose: to expand students ' understanding of modeling as a method of scientific knowledge, to introduce the use of computer as a means of knowledge and research activities  Content: Modeling as a method of knowledge. Information model. The most important concepts associated with mathematical modeling. Technology of mathematical modeling and its stages. Modeling of physical processes. The motion of objects in the environment taking into account friction. Simulation of motion of celestial bodies and charged particles. Oscillatory process. Description of physical processes in the continuous medium approximation  Learning outcome:  Know: methods for solving basic mathematical problems-integration, differentiation, solving linear and transcendental equations and systems of equations using computers; basic principles of mathematical models.  To be able: develop algorithms and programs for solving computational problems, taking into account the necessary accuracy of the result; select analytical methods for the study of mathematical models; use numerical methods to study mathematical models.  Skills: solving computational problems using computer simulation.
9	Programming in Python 3	6	Languages and technology of programming	The theory of programming languages and translation methods	Purpose: the Main purpose of this training course is to familiarize with the object-oriented programming language Python, language syntax, technology and methods of programming in the Python environment, teaching practical skills of programming in Python to solve typical problems of mathematics and computer science.  Contents: System programming. Development of programs with a graphical interface. Development of dynamic websites. Component integration.  Learning outcome:  Know: a programming Language. NumPy. SciPy. Basic knowledge of computer science. Organization of operating system procedures. Development of programs of complex structure.  To be able: I / o Software.  Skills: Software of a microprocessor of the computer.Basics of working with the operating system. Matplotlib . C++ Boost. Java. System programming.
9	Basics of programming in Python	6	Languages and technology of programming	The theory of programming languages and translation methods	<b>Purpose:</b> the main purpose of the course is the formation of basic concepts of structural programming, the development of students 'logic.A superficial understanding of

					programming languages and their historical development, methods of translation of program code. Data types and data structures, variables, expressions, branches, and loops. Data input and output. Concept of function, local and global variables.  Contents: Graphical user interface. History of programming languages. Compilation and interpretation. Data types in programming. Data structure. Methods of translation of program code. Web application testing automation and Splinter library.  Learning outcome:  Know: the Formation of skills in the Python programming system.  To be able: Learning programming algorithmization in the development of thinking. ICT at the professional level. Modeling as a tool of cognition. Machine learning, data analysis and visualization.  Skills: Mapping different URLS to parts of Python code, working with databases, creating HTML views to display on user devices.
10	Numeral Methods	5	Mathematics 1, Mathematics 2, Discrete mathematics	Preparation of the graduation work	Purpose: the discipline is teaching methods of construction, theoretical justification, the use of numerical algorithms for solving various classes of mathematical problems.  Content: Introduction. Numerical methods of algebra. Approximation of functions. Numerical integration. Methods of numerical solution of ordinary differential equations.  Learning outcome:  Know: fundamentals of error theory and approximation theory; basic numerical methods of algebra; methods of constructing the best approximation elements; methods of numerical differentiation polynomials; methods of numerical differentiation and integration; methods of numerical solution of ordinary differential equations; methods of numerical solution of partial differential equations;  To be able: numerically solve algebraic and transcendental equations, applying for this consequence of the theorem of compressive maps;  Skills: practical assessment of the accuracy of the results obtained in the course of solving certain computational problems, based on the theory of approximations; technologies for the use of computational methods for solving specific problems from various fields of mathematics and its applications.

10	Methods of optimization and reseatch operations	5	Mathematics 1, Mathematics 2, Discrete mathematics	Preparation of the graduation work	Purpose:to learn the theoretical and practical material presented in the course of optimization methods and operation research  Content: Linear programming. Solving linear programming problems. Dual linear programming problems. Transport problem. Integer programming. Multicriteria optimization problems. Function optimization methods. Methods search for extrema of functions of one variable. Search for extremums of the function of several variables (unconditional optimization). Nonlinear programming. Methods of fines. Quadratic programming. Dynamic programming models.  Learning outcome:  Know: Methods for optimization of functions. Methods search for extrema of functions of one variable.  To be able: optimization methods to perform a number of tasks  Skills: technologies of application of computational methods for solving specific problems in various fields of mathematics and its applications.
11	Object- oriented programming	5	Programming in Python 3	Methods of teaching Informatics	Purpose: mastering the skills of modern approach to object programming, writing programs in object-oriented languages.  Contents: Introduction to GOE. Structural features of object-oriented languages. Heredity and composition. Fundamentals of object-oriented analysis and design.  Learning outcome:  Know: what is an object and a class, the basic principles of object-oriented programming, the principles of building classes, the criteria for verifying the correctness of the formation of classes, the main trends in the development of technologies of object – oriented programming.  To be able: to apply modern methods of object-oriented programming at coding of program systems of various levels.  Skills: working with visual programming environment C++ Builder
11	Programming in Embarcadero Delphi XE development environment	5	Programming in Python 3	Methods of teaching Informatics	Purpose: formation of students 'knowledge, skills, abilities and skills necessary to solve the tasks set in the Address of the President of the Republic of Kazakhstan N. A. Nazarbayev to the people of Kazakhstan. Application development is done as quickly as possible, requires fewer developers, and is done for Windows platforms and databases. Create high-quality code in modeling.  Contents: improved search and IDE Insight.C++. Windows.Ma. iOS. Android. Object Pascal. 3.  Learning outcome:  Know: SQL Server, Oracle, Multi-Device, SQLite, 3D graphics, Float and Path animations.

					<b>To be able:</b> make a timeline of the methods in the
					Delphi applications.
					Skills: advanced code formatting settings.
					Purpose:to give students the necessary
					knowledge, skills and abilities in the field of
					modern information technologies currently used,
					as well as information security.
					II V
					<b>Content:</b> information security refers to the
					protection of information from accidental or
					intentional natural or artificial impacts that may
					cause damage to the owners or users of the
					information. The purpose of this discipline is to
					teach students to protect the values of the system,
					to protect and guarantee the accuracy and
					integrity of information, to minimize losses if the
					information is modified or destroyed
					Learning outcome:
					<b>Know:</b> the basic concepts and directions in the
	Hardware and		T., C., 4:		protection of computer information, the
12	software	5	Information and	Database	principles of information security, classification
12	protection of		communication	programming	principles and examples of security threats to
	information		technology		computer systems; methods of assessing the
					results of the application of organizational and
					technical solutions to ensure information security.
					To be able: configure the built-in security tools in the operating system, analyze the security of
					in the operating system, analyze the security of the computer and the network environment using
					a security scanner;
					to install and use one of the means for information
					encryption and data exchange organization with
					the use of electronic digital signature; to evaluate
					the effectiveness of hardware and software used
					to ensure information security.
					<b>Skills:</b> security audit of information systems,
					methods of system analysis of information
					systems; control of implementation of plans of
					technical counteraction to threats of information
					of the organization
					Purpose:to give students the necessary
					knowledge, skills and abilities in the field of
					modern information technologies currently used,
					as well as information security.
					<b>Content:</b> the Study of means and methods of
					information security, combating unauthorized
					access to computer resources both in the local
					network and on the Internet.
12	Information	_	Information and	Dotoboss	Learning outcome:
		5	communication	Database	<b>Know:</b> the method of analysis of the
	security		technology	programming	effectiveness of IS; basic concepts, goals and
					objectives of IS in the enterprise; the essence and
					components of IS; principles of organization and
					stages of development of IS; factors affecting the
					organization of IS
					<b>To be able:</b> analyze the effectiveness of the IS;
					use the principles of organization and stages of
					development of IS; identify factors affecting the
					organization of IS
L	l .	l	l .	L	. 0

			1	<u> </u>	Chiller convity andit of information australia
					<b>Skills:</b> security audit of information systems, methods of system analysis of information
					•
					Systems  Purpose: to study the methods of teaching
13	Methods of teaching Informatics	5	Information and communication technology	Preparation of the graduation work	Purpose: to study the methods of teaching computer science, computer education, methods of teaching the basics of programming and algorithmic languages.  Content: Introduction. General questions of methods of teaching Informatics. Modern computer facilities. Operating systems and software. Methods of teaching programming technology. Means of communication with a personal computer.  Learning outcome:  Know: the basic concepts of teaching computer science, programs and textbooks developed on their basis; the value and ways of differentiated and specialized training in the basics of computer science; requirements for the computer science classroom at school and the organization of work in it; the content of the teacher's work on the organization, planning and provision of computer science lessons.  To be able: formulate the objectives of the lesson; plan the learning process based on the goals of the topic or lesson, to predict the cognitive activity of students; select training material and learning tools for the lesson in accordance with its objectives; plan the study of educational material during the year, topics.  Skills: basic methods of studying concepts, means of training, forms, methods and means of control and assessment of knowledge;
13	Methods and technology of teaching Informatics	5	Information and communication technology	Preparation of the graduation work	Purpose: The main purpose of the course is to provide students with a strong and conscious mastery of the basics of knowledge about the processes of transformation, transmission and use of information, the role of information processes in the formation of the modern scientific picture of the world, instilling in students the skills of conscious and rational use of computers in their educational  Contents: programming language C ++ Builder in visual mode in volume. Basic properties of information. Organization of information and activity planning. Modern information and communication technologies. Information and information processes. Number systems and the basics of logic. Basics of programming. Formalization and modeling. Technology of graphic information processing. Telecommunication technologies.  Learning outcome:

					Know: Technology and methodology for the
					study of information processes. Technology and
					methodology of studying the basics of
					algorithmization.
					<b>To be able:</b> Technology and methods of studying
					the device computer. Computer simulation.
					<b>Skills:</b> Software and mathematics. Means of
					Informatization.Social Informatics.Theoretical
			MAI	N DISCIPLINE	Informatics.
				ive courses (EC	
					<b>Purpose:</b> to form students 'holistic understanding
					of the processes of information transformation,
					information exchange system, tasks and functions
					of information systems, the principles underlying
					their classification, data models, presentation of
					data in computer memory, the basics of the
					processes of design, creation, operation and
					modernization of information systems, the
					prospects for the development of information
					processes and systems.
					<b>Content:</b> Information systems. Classification of
					information systems. Life cycle of information
					systems. The main phases of information system
					design the Structure of the information system life
					cycle. Models of information system life cycle.
	Informational	5	Information and	Database	Methodology and technology of information
1	systems	J	communication	programming	systems development. Relational database.
			technology		Relational database management. Managing
					database objects.
					Learning outcome:
					<b>Know:</b> the composition and structure of
					information systems, hardware and software and
					have an idea of the structure of the information
					process, know the basics of information
					processes;
					To be able: use the system analysis in the
					formulation and algorithmization of information
					system problems, determine the conceptual model
					of information systems;
					<b>Skills:</b> system analysis in the formulation and formulation of information system tasks the
					formalization of information system tasks, the definition of a conceptual model of information
					systems.
					<b>Purpose:</b> this discipline is the formation of
					special in the field of building models and
	The theory of	5	Information and	Database	methods of information systems of different
1	information	5	communication	programming	classes and purposes.
	systems		technology		Contents: the Main tasks of the theory of
					systems. Brief historical summary. Terminology of systems theory. System analysis.
				1	of systems theory. System analysis.

					Kachestennye and Kolichestvennye description methods, is. Cybernetic approach.  Learning outcome:  Know: basics of organization of information processes; know the methods of formalized description of information processes and objects, the main phases of the principles of its application in the development of computer technology and software;  To be able: apply basic models and means of information transmission to optimize modern computer systems.  Skills: understanding the basic concepts of information theory: classification and measurement of information, transmission speed and mathematical models of signals
2	Web development	6	World information resources	Multimedia technologies	Purpose:is the development of practical techniques of Web-design and Web-programming.  Contents: Introduction to Web-design. Global computer networks: basic concepts, principles of operation. Resource directories. Search engine. Hypertext markup language HTML pages: the overall structure of the document, paragraphs, colors, links. Hypertext markup language of HTML pages: lists, graphics (graphic formats, graphic object as a link). Hypertext markup language for HTML pages  Learning outcome:  Know: HTML hypertext markup language; basics of working with programs for creating web pages programming Languages Java Script, VRML  To be able: plan the amount of work when developing a Web page; develop the structure and design of a Web page; create Web pages in JavaScript programming languages; publish pages on the Internet.  Skills: working with tools for developing and debugging client and server parts of Internet applications.
2	Programming technology	6	World information resources	Multimedia software	Purpose: formation of students 'scientific, creative approach to the development of technologies, methods and means of software production.  Contents: the Course is devoted to the study of high-level programming techniques. Deals with the standard tasks and the typical examples from the practice of programming. Solving computational and programming problems.  Learning outcome:  Know: programming languages and technology To be able: plan and organize a scientific, creative approach to the development of technologies, methods and means of programming

3	The theoretical basis for the development and implementatio n of programming languages	6	SOFTWARE development basics, Theory of languages and automata	Theory of language programming and translation methods	languages;  To be able: carry out methodological substantiation of scientific research; apply modern methods of scientific research to form judgments and conclusions on the problems of information technologies and systems; carry out mathematical formulation of the studied problems, apply the apparatus of neural networks in the field of information technology; to carry out the analysis of scientific results in the field of theoretical foundations of programming languages; independently carry out research in the field of modern theory of programming languages;  Skills: logical and methodological analysis of scientific research and its results; methods of scientific search and intellectual analysis
					of scientific information in solving new problems.
3	SQL language	6	SOFTWARE development basics, Theory of languages and automata	Theory of language programming and translation methods	Purpose: to Acquaint with information technology, acquisition of database administration and methods of optimization of SQL-server functioning.

					additional functions for processing strings, dates, mathematically, etc., authentication support Learning outcome:  Know: the basic provisions of the theory of databases, data warehouses, knowledge bases; the basic principles of construction of conceptual, logical and physical data models; modern tools for database schema development;  To be able: create database objects in modern database management systems and manage access to these objects; work with modern Casebased database design tools; form and configure the database schema; develop applications using
					the SQL language; Skills: working with database objects in a particular database management system; using database populating tools; using standard
4	The theory of programming languages and translation methods	5	Programming in Python 3, Theory of languages and automata, The theoretical basis for the development and implementation of programming languages,	Preparation of the graduation work	Purpose:Training of competitive specialists of the highest and middle level, ensuring the organization of the use of modern information resources. The main objective of the discipline is to provide students with solid knowledge and practical skills in the field determined by the main purpose of the course.  Contents: Translators. Purpose, classification. The main components of the broadcast. Some aspects of the compilation process. The design of the compiler. Grammars and languages. Two strategies of analysis. Scanner. Regular expressions and finite automata. Deterministic finite state machine. The representation in the computer. Non-deterministic finite state machine. The construction of the KA NKA. Programming the scanner. Statechart. Methods of parsing. Topdown parsing. LL (1) is a parsing method. LL (1)-parse table. Bottom-up parsing. Methods based on precedence. Precedence relations. The grammar is simple precedence.  Learning outcome:  Know: programming, the basic provisions of the theory of formal grammars of languages of automata, methods of syntactic analysis and translation for classes of formal grammars used to describe the basic structures of programming languages;  To be able: formally describe the syntax and semantics of simple procedural-oriented and problem-oriented programming languages, develop syntactic analysis algorithms for the most frequently used formal grammars, use standard terminology definitions, read scientific articles and use literature to independently solve research problems related to the development of languages and methods of translation;

					<b>Skills:</b> basic methods of promising areas of work and methodological approaches in the field of formal methods of description of languages and
4	High-level programing language	5	Programming in Python 3, Theory of languages and automata, The theoretical basis for the development and implementation of programming languages,	Preparation of the graduation work	methods of translation.  Purpose:expansion of professional Outlook of students, acquaintance with technologies of modular programming, development of process of development of a software product with use of modern methods and technologies.  General principles of software development. Features of object - oriented programming in Delphi.  Contents: programming in Delphi. Distributed programming technologies (COM, CORBA). Network programming. Working with remote objects. Servlets. Servlets and ambiguity. Processing sessions. Embedded object. Remote method invocation (RMI). Modern object-oriented programming development environment (Visual Studio NET, C#)  Learning outcome:  Know: formally describe the syntax and semantics of simple procedure-oriented and problem-oriented programming languages, develop syntactic analysis algorithms for the most frequently used formal grammars, use standard terminology definitions  To be able: Create document structure, Apply the basic language tags, Use the tags to format document, to Use META-instructions, Insert images, Create lists, Apply the hyperlink to Use CSS, Use a DIV element, Create the site structure fixed design, Create a site structure rubber design, the Connect JS files to Use functions and scripts to Work with the operators conditions Apply loop statements, Working with arrays  Skills: creating interactivity; writing scripts in the client programming language JavaScript
5	Parallel Computing	5	Hardware and software protection of information	Preparation of the graduation work	Purpose:this course is to acquire knowledge and skills on the basics of parallel programming and parallel data processing using computer tools.  Contents: Introduction. Demand for parallel computers. Parallelism. Evaluation of the effectiveness of parallel programming. Processes and synchronization. Parallel algorithm. Parallel programming.  Learning outcome:  Know: basic models of parallel computers; basics of parallel data processing;  To be able: program and create software products with the application parallel algorithms in programming languages that support parallelization, as well as using MPI, OpenMP, PVM technologies  Skills: building parallel analogues of computational algorithms.

5	Multiprocessor computer systems and parallel programming	5	Hardware and software protection of information	Preparation of the graduation work	Purpose:to study the features of the organization of computers, computer systems and networks, the principles of construction of individual devices and their interaction in the process of input, processing and output. The objectives of the discipline-the study of the principles of functional and structural organization of computers, systems, complexes and computer networks, arithmetic, logical and schematic foundations of computers.  Contents: Introduction to multiprocessor computing systems. Architecture of multiprocessor computing systems. Methods and algorithms of parallel computing programming. Parallel programming using PVM. Parallel programming using MPI.  Learning outcome:  Know: an efficient parallel computation algorithm for solving applied problems.
6	Systems of artificial intellect	5	Theory of languages and automata	Preparation of the graduation work	To be able: reasonably use computer technology in automation systems;  Skills: choosing the optimal network technology for information support of management systems  Purpose:introduction to the problems and methods of solving problems of artificial intelligence development.  Contents: Introduction. Conceptual foundations of artificial intelligence. The basic concepts of AI. Problems and methods of AI. Pattern recognition. Methods of knowledge representation. First order predicate logic. Semantic networks and frames.  Learning outcome:  Know: history of development of systems and methods of artificial intelligence; classification of artificial intelligence systems; languages of artificial intelligence.  Be able to: represent knowledge in artificial intelligence methods for solving practical problems; calculate predicates; make computer programs using object-oriented programming
					methods for solving practical problems by artificial intelligence methods.  Skills: practical implementation of artificial intelligence systems; visual presentation of the results obtained by artificial intelligence methods; application of artificial intelligence applications; development of computer programs for solving practical problems by artificial intelligence methods.  Purpose:to study the General concepts and
6	The theory of artificial intellect	5	Theory of languages and automata	Preparation of the graduation work	terminology of artificial intelligence (AI) as an applied science, architecture of AI systems in modern production, tools for implementing AI principles in mechatronic and robotic systems, as

					well as the acquisition of basic skills in the field of automation of solving complex problems that are still considered the prerogative of man, including the design of intelligent systems (is) for industrial purposes.  Contents: General information. AI problems in robotics and mechatronics. Basic definition. AI problems in robotics and mechatronics. Structure
					and functions of the intelligent control system. Scientific schools in the field of AI. The history of the development of AI systems.  Learning outcome:  Know:history of development of artificial intelligence; problems to be solved by methods of artificial intelligence; classification of systems of artificial intelligence; artificial intelligence.  To be able: represent knowledge in artificial intelligence systems; choose artificial intelligence methods for solving practical problems; calculate predicates; make computer programs using object-oriented programming methods for solving practical problems by artificial intelligence methods.
					<b>Skills:</b> practical implementation of artificial intelligence systems; visual presentation of the results obtained by artificial intelligence methods; application of artificial intelligence applications; development of computer programs for solving practical problems by artificial intelligence methods.
7	Multimedia technologies	5	Web development, Computing modelling, World information resources	Preparation of the graduation work	The purpose of studying this discipline: review and analysis of the design and construction of multimedia systems; study of the methodology of design and construction of multimedia systems.  Content: Basic concepts of Multimedia technology. Hardware and software and multimedia production technology. Overview of multimedia equipment. The main components of a multimedia application and software for their development and processing. Technology for the production of multimedia applications. Multimedia author systems.  Expected result:  Know: basic methodological skills of multimedia systems; multimedia implementation technology; drawing modeling technology;  Be able to: design multimedia systems; develop a modular project structure; use built-in language capabilities designing multimedia systems  creating multimedia applications  Skills: develop skills in multimedia programs and tools
7	Multimedia software	5	Web development, Computing modelling,	Preparation of the graduation work	The purpose of studying this discipline: the study of multimedia technology.  Content: Basic concepts of multimedia technologies. Hardware and software and

			World information resources		multimedia production technology. Overview of the multimedia hardware. The main components of multimedia applications and software for their development and processing. Technology for the production of multimedia applications. Multimedia author systems.  Expected result:  Must know: digital video and sound for the development of design projects and presentations of design objects; functionality of modern programs used to create multimedia products.;  Be able to: input, store, process, transmit and publish digital information, including sound, images, video and multimedia products on a personal computer and in global computer networks; store the finished multimedia product on modern component devices.  Skills: programming in Flash Professional environment. methods and tools for creating modern multimedia products
8	Database programming	5	Programming in Python 3, Informational systems	Preparation of the graduation work	Purpose:study of database design techniques used in the development of information systems used in various fields of economic activity;mastering the theoretical foundations of database construction.  Contents: basic concepts of database theory. Data Bank as an information system. Database typology. Transaction processing systems. Data integrity and security. Data warehouse. Objectoriented databases. Distributed databases and client-server systems. Promising models of databases. Publication of databases on the Internet. Modern DBMS and their application. Organization of data warehouses.  Learning outcome:  Know: the basic concepts of building database models, methods and tools for designing relational databases, especially the preparation of programs for interaction with databases, database organization, ways to protect data by DBMS, the basics of differentiation of access rights, the basics of SQL language for working with data organized in the form of a relational database;  To be able: program databases in different programming environments;  Skills: development of database software designed to solve economic, scientific and technical problems.
8	Programming in PHP	5	Programming in Python 3, Informational systems	Preparation of the graduation work	Purpose: to get acquainted with one of the most popular languages for the implementation of web applications. This course is devoted to the study of its basics. The emphasis is on the practical application of the acquired skills. PHP language was created to solve a specific practical problem in the Internet environment. Familiarity with the

	PHP language, development of skills in design and programming of web applications.  Contents: Discusses how to separate statements, create comments, variables, constants and data types, operators. Conditional statements (if, switch), working with loops (while, for, foreach) and using include, require functions.  Learning outcome:  Know: the language of programming PHP, developing skills of designing and programming web applications  To be able: apply PHP programming language to develop web application. PHP language was created to solve a specific practical problem in the Internet environment.
	Internet environment. <b>Skills:</b> designing a web application using theoretical and practical skills in PHP programming environment

## LIST OF COMPONENTS BY CHOICE

for an educational program

## 6B06122 «Informatics»

Form of training: Full-time

Training period: 2 years

Group of educational programs: 5B057-Information technology specialty

term of study-2 years

Year of admission 2020

	term of study 2 years		01 00111100	1011 2020
№	Name of discipline	Code of discipline	Number of credits	Semester
	2.Basic disciplines	•		
	Component on a choice 1			
1	Computer architecture	CA 1213	4	1
	Techics of computer and communication systems	TCCS 1213	4	1
	Component on a choice 2			
2	Application packages program	APP 2214	6	1
	Applied software	AS 2214	6	1
	Component on a choice 3			
3	Informational resources	IR 1215		
	Informational systems	IS 1215	6	1
	Component on a choice 4			
4	Discrete mathematics	DM 2216	5	2
	Math statistics	MS 2216	3	2
	Component on a choice 5			
5	Theory of languages and automata	TLA 3217	5	2
	Algorithmic languages and programming	ALP 3218	3	2
	Component on a choice 6			
6	Computer SOFTWARE	CS 1216	5	2
	Practices on the electronic computer	PEC 1216	3	2
	Component on a choice 7			
7	Art programming	AP 2217	_	_
	Basics of programming	BP 2217	5	3
	Component on a choice 8			
8	Computing modelling	CM 3220	5	3
	Mathematical and computer modeling	MCM 3220	3	<u> </u>

	Component on a choice 9			
9	Programming in Python 3	PP 3221		
	Basics of programming in Python	BPP 3221	6	3
	Component on a choice 10			
10	Numeral Methods	NM 3222		
10	Methods of optimization and research operations	MORO 3222	5	3
	Component on a choice 11			
	Object-oriented programming	OOP 4223		
11	Programming in Embarcadero Delphi XE development environment	PEDXDE 4223	5	3
	Component on a choice 12			
12	Hardware and software protection of information	HSPI 4224	~	
	Information security	IS 4224	5	4
	Component on a choice 13			
10	Methods of teaching Informatics	MTI 4225		
13	Methods and technology of teaching Informatics	MTTI 4226	5	4
	3.The main subjects			
	Component on a choice 1			
1	Informational systems	IS 3305	5	3
	The theory of information systems	TIS 3305	3	3
	Component on a choice 2			
2	Web development	WP 3306	6	3
	Programming technology	PT 3306	O	3
	Component on a choice 3			
3	The theoretical basis for the development and implementation of	ED D VD V 2205		
	programming languages	TBDIPL 3307	6	3
	SQL language	SQLL 3307		
	Component on a choice 4			
4	The theory of programming languages and translation methods	TDI TM 4200	_	_
		TPLTM 4308 HPL 4308	5	5
	High-level programming language	HPL 4308		
_	Component on a choice 5  Parallel Computing	DC 4200		
5		PC 4309 MCSPP 4309	5	5
	Multiprocessor computer systems and parallel programming	MCSPP 4309		
_	Component on a choice 6	GAT 4210		
6	Systems of artificial intellect	SAI 4310	5	5
	Theory of artificial intellect	TAI 4310		
	Component on a choice 7	MT 2211		
7	Multimedia technologies	MT 2311	5	5
	Multimedia software	MS 2311	J	
	Component on a choice 8			
8	Database programming	DP 4312	<u>~</u>	
O	Programming in PHP	PPHP 4312	5	5
